

Random Experiment

An experiment whose outcome is called a random experiment if

- All possible outcomes of E are known in advance.
- It is impossible to predict which outcome will occur at a particular performance of E .
- E can be repeated.

Q. If the experiment consists of flipping 2 coins, then what is the sample space?

Soln. $\{(\text{H}, \text{H}), (\text{H}, \text{T}), (\text{T}, \text{T}), (\text{T}, \text{H})\}$

Axiom 1 :- $0 \leq P(E) \leq 1$.

Axiom 2 :- $P(\Omega) = 1$.

Axiom 3 :- $P\left(\bigcup_{i=1}^{\infty} E_i\right) = \sum_{i=1}^{\infty} P(E_i)$.

Q. If two dice are rolled, what is the probability that the sum of the upturned faces will equal 7?

Soln. $\frac{1}{6}$

Q. If 3 balls are randomly drawn from 6 white & 5 black ball, what is the probability that one of the drawn ball is white & other 2 black?

Soln.

$$\frac{6C_1 \cdot 5C_2}{11C_3}$$

Conditional Probability

Let A & B be any two events connected to a given random experiment E.

Then the conditional probability of the

event A on the hypothesis that

the event B has occurred

denoted by $P(A|B)$ is

defined as :-

$$P(A|B) = \frac{P(AB)}{P(B)}$$

provided $P(B) \neq 0$.

Q A coin is flipped. We assume that the sample space are equally likely, what is the conditional probability that both flips result in head, given that the first flip does?

Soln.

$$\frac{P(AB)}{P(B)} = \frac{\frac{1}{4}}{\frac{1}{2}} = \frac{1}{2}.$$

$E = \{(H, H)\}$ denotes the event that both flips land head.

$F = \{(H, H), (H, T)\}$ the event that the first flip lands head.

$$P(E|F) = \frac{P(EF)}{P(F)} = \frac{P(ENF)}{P(F)} = \frac{P((H, H))}{P((H, H), (H, T))} = \frac{1}{2}.$$

We need to find the probability of getting two heads out of two trials.

What is the answer out of two trials?

1/2

(3)

Q. In an exam 30% of the students failed in maths, 15% of the students failed in chemistry. 10% of the students failed both chemistry & maths. A student is selected at random. If he failed in chemistry, then what is the probability he passed.

$$\text{Soln. } P(A|B) = \frac{P(A \cap B)}{P(A) + P(B)} = \frac{\frac{1}{10}}{\frac{10}{36} + \frac{15}{36}} = \frac{0.1}{0.45} = \frac{10}{45} = \frac{2}{9}.$$

$$1 - P(A) = \frac{1}{3}.$$

Q. Two players A & B alternatively throw a pair of die. A wins if A throws 6 before B, throws 7 before A throws 6.
If A begins, then the probability that A wins is ?

Soln.

$$\begin{aligned} & \left(\frac{5}{36} \right) + \left(\frac{31}{36} \cdot \frac{5}{6} \right) + \left(\frac{31}{36} \cdot \frac{5}{6} \right)^2 + \dots \\ & \quad + \left(\frac{31}{36} \cdot \frac{5}{6} \right)^3 + \left(\frac{31}{36} \cdot \frac{5}{6} \right)^4 + \dots \end{aligned}$$

$$\begin{aligned} & \frac{5}{36} \left[1 + \left(\frac{31}{36} \cdot \frac{5}{6} \right) + \left(\frac{31}{36} \cdot \frac{5}{6} \right)^2 + \dots \right] \\ & = \frac{30}{61} \end{aligned}$$

Mutually Exclusive events :- Two events

connected to a given random experiment E are said to be mutually exclusive if $A \cap B$ can never happen simultaneously, if $P(A \cap B) = 0$.

Example. Random experiment of throwing a die, the events multiple of 3 and a prime no. are not mutually exclusive.

But the events odd no. & even no are mutually exclusive.

Exhaustive set of Events

The collection of events $\{A_\alpha : \alpha \in I\}$ is exhaustive.

if and only if $\sum_{\alpha \in I} A_\alpha = S$, where I is an Index

Set: $\{A_1, A_2, \dots, A_n\}$ is called an Index

in the corresponding event space.

e.g. The random experiment of throwing a die, the collection of events $\{A_1, A_2, A_3\}$ is exhaustive where $A_1 = \{1, 3, 5\}$, $A_2 = \{2\}$, $A_3 = \{4, 6\}$.

Theorem: If A_1, A_2, \dots, A_n be pairwise mutually exhaustive events one which certainly occur then

$$P(B) = \sum_{i=1}^n P(A_i) P(B|A_i)$$

Problem 1

A jar contains 2 white balls & 3 black balls.

The balls are drawn from the jar one by one and placed on the table in the order drawn. What is the probability that they are drawn in the order white, black, black, white, black?

$$\frac{2}{5} \times \frac{1}{4} \times \frac{1}{3} \times \frac{1}{2} \times 1$$

$$= \frac{1}{10}$$

Baye's Theorem

Let $A_1, A_2, A_3, \dots, A_n$ be n pairwise mutually exclusive events connected to a random experiment E where at least one of $A_1, A_2, A_3, \dots, A_n$ is sure to happen. Let X be an arbitrary event connected to E where $P(X) \neq 0$. Also let probabilities $P(X|A_1), P(X|A_2), \dots, P(X|A_n)$ are all known.

Then,

$$P(A_i|X) = \frac{P(X|A_i) \cdot P(A_i)}{\sum_{r=1}^n P(A_r) P(X|A_r)}$$

Problem

② ~~Som~~ From an urn containing 5 white & 5 black balls, 5 balls are transferred at random into an empty second urn from which one ball is drawn and it is found to be white. What is the probability that all balls transferred from the first urn are white?

~~Soln~~ $\epsilon_0 = 5$ black balls drawn from the 1st urn,
 $\epsilon_1 = 1$ white & 4 black balls

$$\epsilon_2 = 2W \& 3B \quad \epsilon_3 = 3W \& 2B \quad \epsilon_4 = 4W \& 1B \quad \epsilon_5 = 5W \& 0B$$

Soln contd →

The chance that a doctor will diagnose a certain disease correctly is 60%, the chance that a patient will die by his treatment after correct diagnosis is 40%. And the chance of death by wrong diagnosis is 70%. A patient of the doctor who had the disease died. What is the probability that the disease was diagnosed correctly?

Let X be the event one white drawn from the 2nd urn. (3)

$$P(E_0) = \frac{5C_5}{10C_5} = \frac{1}{252} = P(E_5).$$

$$P(E_1) = \frac{5C_1 \times 5C_4}{252} = \frac{25}{252} = P(E_4)$$

$$P(E_2) = \frac{5C_2 \times 5C_3}{252} = P(E_3) = \frac{25}{63} = \frac{1 \times \frac{1}{252}}{0 \times \frac{1}{252} + \frac{1}{5} \times \frac{25}{252}}$$

$$P(X|E_0) = 0$$

~~$P(X|E_1) = 1/5$~~

$P(X|E_2) = 2/5$

$P(X|E_3) = 3/5$

$P(X|E_4) = 4/5$

$P(X|E_5) = 1,$

$+ \frac{2}{5} \times \frac{25}{63}$

$+ \frac{3}{5} \times \frac{25}{252}$

$+ \frac{4}{5} \times \frac{25}{252}$

$+ 1 \times 1.$

$= \frac{1}{126}.$

$\epsilon_{\text{correct diagnosis}} = 0.6 \quad \text{wrong diagnosis} = 0.4.$

Som ③ .

$P(\text{die} | \epsilon_{\text{correct diagnosis}}) = 0.4$

$P(\text{die} | \epsilon_{\text{wrong diagnosis}}) = 0.7$

$$\begin{aligned} P(\text{die} | \epsilon_{\text{correct}}) &= \frac{P(\text{die}) \cdot P(\text{die} | \epsilon_{\text{correct}})}{P(\text{die}) \cdot P(\text{die} | \epsilon_{\text{correct}}) + P(\text{die} | \epsilon_{\text{wrong}}) \cdot P(\epsilon_{\text{wrong}})} \\ &= \frac{0.6 \times 0.4}{0.6 \times 0.4 + 0.4 \times 0.7} \\ &= \frac{0.24}{0.24 + 0.28} \\ &= \frac{24}{52} = \frac{12}{26} = \frac{6}{13}. \end{aligned}$$

- Q. Sum of 2 numbers is $2n$. Find the probability that their product is not less than $\frac{3}{4}$ the maximum prob.

Soln.

$$\text{Max Product} = n^2.$$

$$\therefore \text{Product} \geq \left(n^2 \cdot \frac{3}{4}\right)$$

$$n(2n-x) \geq \frac{3}{4}n^2$$

$$\Rightarrow 2nx - x^2 \geq \frac{3}{4}n^2$$

$$\Rightarrow x^2 - 2nx + \frac{3}{4}n^2 \leq 0$$

$$4x^2 - 8nx + 3n^2 \leq 0$$

$$\Rightarrow (2n-x)(2n-3x) \leq 0$$

$$\Rightarrow \frac{n}{2} \leq x \leq \frac{3n}{2}$$

$$\frac{3n}{2} - \frac{n}{2} = \frac{2n}{2} = n$$

Ans: $\frac{\text{Favourable Range}}{\text{Total Range}} = \frac{1}{2n} = \frac{1}{2}$.

- Q. A 5 figure No. is formed by digits 0, 1, 2, 3, 4 without repetition. Probability that the number formed is divisible by 4.

Soln

$$\text{Total cases} \rightarrow 3 \times 2 \times 1$$

$$\frac{3}{2} \rightarrow 2 \times 1 + 2 \times 1$$

(0 cannot be in MSB)

$$\text{Total} = 4! \times 4$$

$$\sigma_x^2 = E(x - \bar{x})^2$$

$$= \frac{1}{n} \sum (x_i - \bar{x})^2$$

$$S_{yy}^2 = \frac{\sum y_i^2 - \bar{y}^2}{n-1} = \frac{\sum (n_i y_i)^2 - \bar{y}^2}{n-1} = \frac{\sum n_i y_i^2 - \bar{y}^2}{n-1}$$

$$\text{variance is } \frac{\sum (x_i - \bar{x})^2}{n} = s^2 = \text{SD}^2 = \frac{\sum (n_i x_i)}{n} - \bar{x}$$

change of origin but

change of origin but
depends on the change of scale.

$$u_i = \frac{y^o - c}{d}, \quad y^o = u_i d + c$$

$$\text{cov}(x_1 y) = d d' \text{ cov}(u, v)$$

$$f'(x) = \frac{1}{h} \Rightarrow S.D \text{ is always } \pm$$

S.D is always positive.

What about covariance?

$\text{cov}(x_1, y)$ may not always give a true result, may give negative value.

$\int P$ is independent of change in origin & scale.

Hint let $v_i = \frac{x_i - \bar{x}}{\sum n}$
 and $(v_i)^2 = \frac{(x_i - \bar{x})^2}{\sum n}$

$(x_1, y_1), \dots, (x_n, y_n)$
then calculate

then calculate

$\sum u_i^2$, $\sum v_i^2$; and $\sum u_i v_i$,
then use the result.

$$(u_i + v_i)^2 \geq 0$$

$$2^{\circ}((u_i - v_i)^2 \geq 0)$$

$$\frac{1}{\mu^2} \leq \frac{1}{\mu} = \left[\left(\frac{1}{\mu} \ln(\mu) \right)^2 \right]^{\frac{1}{2}} = \frac{\sqrt{\ln(\mu)}}{\mu} = \frac{\sqrt{\ln(2)}}{2} = \frac{1}{2\sqrt{e}}$$

Q. Suppose that n pairs of values of 2 variables are $(x_1, y_1), (x_2, y_2), \dots, (x_n, y_n)$,

The variances of $x, y, x-y$ are.

$$x^2 + y^2 = 16^2, \quad 6y^2, \quad 6(x-y)^2 \quad \text{then show}$$

$$g_{xy} = \frac{6x^2 \cdot 6y^2 - 6(x+y)^2(2x+2y)}{26x \cdot 6y}$$

~~Hip~~ → Find 6

Hint

Rewrite. $\Rightarrow \text{and } -6(x-y)^2 = 6x^2 + 6y^2$

∴ -k and input $\frac{2-8}{2+8} = \text{iv}$ - 2 Gx Gy, Gxy

$$\text{Let } u = x - y, \quad \dot{u} = x_i - y_i$$

~~5-12~~ 110m

$$\text{Then, } \boxed{\sigma_u^2 = \frac{1}{n} \sum (u_i - \bar{u})^2}$$

5. Wannen zur Wanne zur Wanne zur Wanne zur Wanne

~~Petru~~

~~→ Gaußbogen~~

Calculate f for the following data! - setting c.

$x_i = 65$	66	67	67	68	69	70	72
$y = 67$	68	72	72	65	68		71

$$f(x_i + d) = f(x_i)$$

$$u = \frac{x - c}{d}$$

$$v = \frac{y - c'}{d}, \quad \left\{ \begin{array}{l} f_{uv} = f_{xy}, \\ f_{uv} = f_{xy}. \end{array} \right.$$

$$f_{uv} = \frac{\text{Cov}(u, v)}{6 \times 6} = \frac{0.603}{36} = 0.0167$$

Ans. (\bar{x}, \bar{y}) to

Note

$$\text{Cov}(x, y) = 0$$

Even though

$$\text{Cov}(x, y) = 0$$

we cannot say all the time

x & y are not related.

Ex. $x = 1, 2, 3, 4, 5, 6, 7$

$y = 9, 4, 1, 0, 1, 4, 9$

and we see x & y are not related

$$\left(\frac{xd}{6} + \frac{yd}{6} \right) \cdot 9$$

$$18 = 9 \cdot 2$$

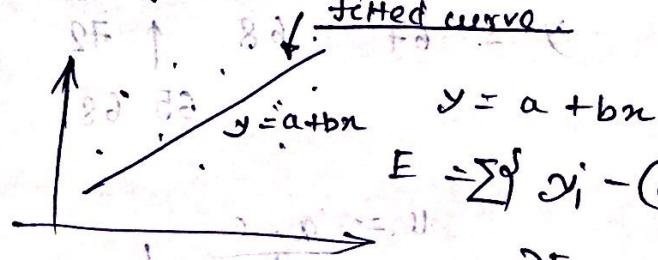

obvious with x & y are not related

$$18 = 9 \cdot 2$$

$$(\text{no. of } 1) : \frac{108}{9} = 12$$

Regression

Predicting the value of one variable given the value of another variable.

$$E = \sum [y_i - (a + bx_i)]^2$$

$$\frac{\partial E}{\partial a} = 0$$

$$\frac{\partial E}{\partial b} = 0$$

We will get 2 regression lines.

They intersect at (\bar{x}, \bar{y}) .

- ① Regression of y on x .
- ② Regression line of x on y .

$$y - \bar{y} = B_{yx} (x - \bar{x})$$

$$x - \bar{x} = B_{xy} (y - \bar{y})$$

$$\begin{aligned} B_{xy} &= \rho_{xy} \cdot \frac{\sigma_x}{\sigma_y} \\ B_{yx} &= \rho_{xy} \cdot \frac{\sigma_y}{\sigma_x} \end{aligned}$$

If θ be the angle b/w 2 regression lines then it can be shown that

$$\tan \theta = \frac{f^2 - 1}{f \cdot \left(\frac{\sigma_x}{\sigma_y} + \frac{\sigma_y}{\sigma_x} \right)}$$

① If $f = \pm 1$, 2 reg. lines will coincide.

② If $f = 0$,

$\theta = 90^\circ$. (\perp to each other).

①

Chebychev Inequality

Let X be a random variable with mean μ and variance σ^2 . Then for any $k \in \mathbb{N}$ with $k \geq 1$,

$$P(|X - \mu| \geq k\sigma) \leq \frac{1}{k^2}$$

$$\text{OR } P(|X - \mu| \leq k\sigma) \geq 1 - \frac{1}{k^2}$$

Proof

$$\begin{aligned} \sigma^2 &= \int_{-\infty}^{\infty} (x - \mu)^2 \cdot f(x) dx \\ &= \int_{-\infty}^{\infty} (x - \mu)^2 \cdot \int_{-\infty}^{\infty} f(x) dx dx \\ &= \int_{-\infty}^{\infty} (x - \mu)^2 \cdot \left(\int_{-\infty}^{u-K\sigma} f(x) dx + \int_{u-K\sigma}^{u+K\sigma} f(x) dx + \int_{u+K\sigma}^{\infty} f(x) dx \right) dx \\ &= \int_{-\infty}^{u-K\sigma} (x - \mu)^2 \cdot f(x) dx + \int_{u+K\sigma}^{\infty} (x - \mu)^2 \cdot f(x) dx \end{aligned}$$

Combining

$$\begin{aligned} |x - \mu| \geq k\sigma &\Rightarrow \int_{-\infty}^{u-K\sigma} f(x) dx + \int_{u+K\sigma}^{\infty} f(x) dx \\ \sigma^2 &\geq k^2 \sigma^2 \left[\int_{-\infty}^{u-K\sigma} f(x) dx + \int_{u+K\sigma}^{\infty} f(x) dx \right] \\ &= k^2 \sigma^2 [P(x \leq u - K\sigma) + P(x \geq u + K\sigma)] \\ &= k^2 \sigma^2 [P(|x - \mu| \geq k\sigma)] \\ \Rightarrow P(|x - \mu| \geq k\sigma) &\leq \frac{1}{k^2} \end{aligned}$$

Applications of Chebychev's Inequality

103/2/3. ②

A symmetric unbiased dice is thrown 600 times.
Probability of finding the lower bound 80 ~ 120 since.

$$P(80 \leq S \leq 120) \geq 0$$

Let S be the total no. of sixes.

$$\text{then } E(S) = 600 \times \frac{1}{6} = 100.$$

$$\text{Var}(S) = 100 \times \frac{5}{6} = \frac{500}{6}$$

$$\Rightarrow P\left(\mu - k\sigma \leq S \leq \mu + k\sigma\right) \geq 1 - \frac{1}{k^2}$$

$$\Rightarrow P\left(100 - \frac{10\sqrt{500}}{6} \leq S \leq 100 + \frac{10\sqrt{500}}{6}\right) \geq 1 - \frac{1}{k^2}$$

$$k = 14$$

Poisson Distribution

Poisson distribution can be approximated to binomial distribution under the following conditions:-
No. of trials n is very large,
Probability of success is too small that np is finite.
